

PROJECT 7 STANDARD GROIN

BRAND: PROJECT 7

The femoral artery and groin area represent one of the most vulnerable and potentially fatal areas on the operator. Despite this, most teams have historically not worn groin protection due to how much it interferes with the operator's movement. Project 7 specifically set out to create a groin/femoral protector that would allow for normal movement by being well-shaped, flexible, and designed to move with the armor system. Attached with two straps that quick connect to MOLLE slots on the inside of the vest, this system takes seconds to put on or remove yet provides significant coverage without sacrificing movement.
